## Note manager notepad app with lists and reminders

The way you take notes is a very personal thing. Do you carefully sub-head, section, and bullet, or quickly smak things anywhere? Are you text-only or are you using multiple scrapbook system? And how do you index and find old notes? Whatever your approach, there are some great digital note-taking apps that can accommodate all your annotated jokes and fantasies. Now one big thing to note. You can write notes on anything: the back of a napkin, an envelope, a scrap of a note, and yes, a notebook. It's the same with apps: you can write notes in a writing app like Ulysses, or throw them in a Google Doc or Gmail document; you can use blank text files or even a quick note app. In this list, we weren't interested in apps that could be used as an app for notes — we only wanted apps that were explicitly designed to be used as an app for notes. This might exclude an app you're using personally, but without this requirement, we'd have to consider whether Excel or Google Spreadsheets are more efficient at taking notes. (The answer is that they are both terrible.) We've also ruled out super-niche notes apps like those designed for fiction writers or developers. Great note-taking apps should be useful for many different purposes and people, not just for a small subset of a small subset. Even with these criteria, we were still looking at almost 40 different applications. Here are our favorites. Best note-taking app? What makes a great note-taking app? With so many apps to consider, we had some pretty strict criteria for what created a great notes app. First, the apps had to do what they set out to do and do it well. Not every note-taking app must have image-to-text features or support styluses, but if it's boasted about them, it should be good. There are so many different ways to use digital notes that what one person considers essential can only miss up the interface to another. Secondly, note-taking apps had to be fast and easy to use. A pen and a scrap of paper are hard to beat for speed and convenience, but any note-taking app has to get out of the way. Creating, editing, and sorting notes must be something that felt seamless and natural, rather than a battle with a terrible user interface. If you couldn't create a new note in seconds or needed to jump through strange hoops to get different tools, the app wasn't on our list. Similarly, your laptop is something that must always be available, whether you're at your desk or in the air flying coast-to-coast. At the very least, we needed apps to be available on one desktop and one mobile platform, and to have some offline functionality. Your access to your notebook can't be cut off because you didn't have Wi-Fi. Finally demanded that the apps be good for money. Free is amazing, of course, but it has to be balanced by the likelihood that the service will survive in the next few years and the availability of server-based features such as synchronization. Some of the best apps charge you prices and, if the prices justify it, there was no barrier to inclusion. The best note-taking app for the ultimate digital laptop? Evernote (Android, iOS, macOS, Windows, Web)! It is impossible to talk about apps for taking notes without mentioning Evernote, so it should come as no surprise to see them on this list. It's one of the most powerful options around and can handle notes in almost any format you want. You can add text notes, audio clips, images, PDFs, scanned handwritten pages, Slack conversations, emails, websites, and anything else you can think of. If you're the kind of person who's just as likely to dood the outline on the best-seller on the back of a napkin as you save your shopping list as a voice note, Evernote is great: it gives you one safe place to throw everything. But Evernote isn't just a dump. It's designed so you can easily sort and organize your notes. Create a new note by clicking New Note, enter what you want, or add one of the supported note types, and you can add tags at the bottom of the screen. If you've already set up any tags, they'll be automatically designed. otherwise, you can enter what you want, and then press Enter. In the sidebar, click Tags to see a searchable list of all the tags you've used. It's a really quick way to sort notes, how to create them without having to worry about putting each note perfectly in place. Of course, later you can dive back and organize all the notes into carefully ordered laptops. In this case, click Notebooks on the sidebar, and then click New Notebook. Give him a name and you'll be able to drag notes from anywhere in Evernote into it. Alternatively, you can right-click the note, click Move To, and select the selected notebook. Evernote takes things one step further with search. When you upload a picture of a sheet of paper, business cards, menus, moles, or anything else with text, Evernote automatically processes the image to make it more readable—and then processes the text to make it searchable. So if you add a photo of your favorite pancake recipe, you will be able to search for it as if it were a text note that you entered yourself. Evernote even works with handwritten notes, albeit with the huge caveat that your writing must be clean enough that your computer can read it. (Mine, unfortunately, is not.) It's similar to PDFs and other documents you upload — if you have a Premium Evernote subscription, the text is searchable throughout the app. Crucially, a Premium Evernote subscription for \$7.99/month must be mentioned. Evernote's free plan doesn't make this list. It is limited to two devices and notes for offline mobile access cannot be saved. There are better, or at least almost as good, but less limited, free options available. However, if you are looking for the ultimate all laptop and monthly fee, then Evernote is an easy app for you. Evernote integrates with Zapier and allows you to automate note-taking. Pro Pro you can automatically create tasks from Evernote reminders or create new notes for calendar events. Evernote Price: Very limited free plan; \$7.99/month for Evernote Premium with unlimited devices and offline mobile access. The best free note-taking app? Microsoft OneNote (iOS, Android, macOS, Windows, Web) Microsoft OneNote is a free and fully equipped note-taking app. It's Microsoft's answer to Evernote, albeit without the need for a monthly subscription. Although, of course, there are other differences. One big one is that OneNote is much more freeform. Each notebook is modeled from a ring so that it is divided into sections with subs sections called Pages. And each page is basically a free canvas where you can add any kind of notes you like wherever you want. This means you can drag an image, click anywhere and add some text notes next to it, and if your pc supports a stylus, scribbly the mustache on everyone in the photo. (Otherwise, you can draw one on with the trackpad, but it will be less stylish.) It strikes me as a purpose-built solution for students and anyone else who has to take long, discursive notes about something, rather than people looking for a digital laptop to collect short snippets and random ideas. I would try to call any of the Microsoft apps intuitive, but OneNote is known. The ribbon at the top of the app has five tabs: Home, which has all the basic formatting tools; Embed, which allows you to attach files, pictures, audio recordings, and everything else; Draw, which gives you all the free drawing and highlighting tools; A view that lets you browse a document and change the look of things, and finally Tell Me, which is a help feature. If you've used a version of Word, Excel, or PowerPoint in the last decade, you'll be home. When it comes to pricing, even if OneNote is free, it uses your OneDrive storage. You get 5GB included, which is more than enough for most people. However, if you're using OneDrive to save photos, or if you're saving a large number of video and audio notes during a four-year college year, you can hit that limit. If you do, you can increase it to 100GB for \$1.99/month. With OneNote Zapier integration, you can automate OneNote to eliminate problems moving information between apps. For example, Zapier can automatically create new notes in OneNote whenever you have a new task, note, or calendar event in another app. OneNote Price: Free up to 5 GB notes; \$1.99/month for 100GB. The best note-taking apps for Apple? Apple Notes users (iOS, macOS, Web) If you're firmly rooted in Apple's ecosystem, you don't have to look too far for a great, free note-taking app. Just go to the icloud.com/notes and you'll get an online, albeit downloaded version of the Mac app with all your synced notes — even if pc or Chromebook. It's a nice bonus bonus prevents your notes from being completely locked into your Apple devices, provided you have enough iCloud space to store everything. Apple Notes is a bit barebones than our previous two picks, but it's not really a dealbreaker. It's convenient, easy to use and even integrates with Siri. Sure, there are no built-in tags, but you can organize notes into as many folders as you need, and there's always a search bar to find everything that's buried. You can search for pictures, text you've written, a specific attachment, artwork, scanned text in a document, or something inside the picture you're trying to find (for example, a wheel). Once you've created a new note, you can add text, attach pictures, scan documents, draw or write by hand, add checklists, format things to tables, and more. You can add several different things to a single note, but unlike OneNote, they're divided into sections. For example, you cannot use a text note using the Pen tool. Of course, as Apple's first-party app, the Notes play nicely with the entire Apple ecosystem. One of the smart features is that you can use your iPhone or iPad to add content directly to notes on your Mac. For example, if you click Scan Document, the camera will open on your iOS device and you'll be able to automatically scan, process, and add letters, recipes, bank statements, and other documents as PDFs. As basic as Apple Notes is, it's very functional and controls all of our requirements for a great note-taking app. Power-user features can be useful, but most users aren't powerful - and Apple knows it. Apple Notes Price: Free for 5GB of storage across all iCloud services; starts at \$0.99/month for 50GB. There is a very healthy ecosystem of apps for Apple devices; However, since they're all paid products and Apple Notes is so good, none of them make this list. For more options, see our selection of the best Mac note-taking apps. The best note-taking apps for Google? Power/Google Keep users (Android, iOS, Web, Chrome) Most people don't take notes just because of that. Instead, they are done to serve a purpose: to remind you to send an email to a friend to help you outline a new book or one of millions of other things. These other things often require the use of another application or service. You can't send an email from a notes app, and while you can outline the book, it's probably not the best place to write it. This is what makes Google Keep such a great choice for Google power users. Google Keep is a bit special. As an app of notes, it's fine. There are reasonable versions of the web, iOS and Android, and a handy Chrome extension to store quick notes and links. But it's how it integrates with other Google services that is so useful. If you're using Google Keep, there's a small light bulb icon in the right sidebar when you open Gmail in your browser. Click on it you have quick access to all Keep notes. You can view all the notes about the thing you're working on, the latest notes, search for something from a while ago, or create a new one by clicking Take Note.... But here's the thing: the same sidebar is there in all your Google Docs, in Google Calendar, and even on Google Drive. The only Google app it's not in is YouTube. And Keep integrates with the rest of Google in other ways. Click the note, and then copy it to Google Docs to rewind it to a new document (you can also drag a note from the sidebar); click the small bell icon to set a reminder and the note will appear in Google Calendar, and if you create an audio note on your smartphone, Google will automatically overwrite it. Indeed, if you live your working life in the Google ecosystem, you should use Keep — even if you're also using another note-taking solution for your personal life. Google Keep Price: Free for 15GB of storage in all Google apps; starts at \$1.99/month for 100GB. The best app for taking notes for collaboration? Noce (Android, iOS, macOS, Windows, Web) Taking notes can be something you do for yourself, or something you do with others and others. All the apps we've looked at so far are mostly for you to take notes for yourself. Sure, you can share and collaborate on notes and even notes, but their main features lie elsewhere. Cooperation on all aspects has been built in from the beginning. The term is the only application on this list that surrounds the provision that it is an application for taking notes. It is, but because of its collaboration features, it can be much more. They're basically three tools in one: a powerful notes app (which is why it's on this list), a task and project manager, and a reference wiki. How you combine these three things is up to you. Each new document or note is called a page, and everything in the term is referred to as a block. Blocks contain basic elements such as text, checklists, and headings, as well as media types such as images, web bookmarks, video, audio, code snippets, and files. You can use as many blocks as you want, in any combination, on each page. They're a super fast insert: just enter/and browse the list. There are plenty of templates built as well, so you don't have to feel like you have to customize absolutely everything when you start. Just click on the templates in the sidebar, see the options, and when you find one that you like, click Apply this template. Sidebar is also the way you browse all pages. It's divided into two parts: Workspace, which are all pages you share with the rest of the team, and Private, where you can have your own notes. While collaboration is a big part of the concept, it is not forced on you. Each has its own section where they can work on things — and then move them to public spaces for feedback and review. It's great how the whole team can work together without preparing each other. One thing to note: The concept of bills yourself as evernote's competitor for pro Users. It may be - but it's too much for most people. If you like the idea of the concept, go ahead and try a free personal plan, but for us, it's really best as a team notes app. Concept Price: Free for personal users; Free trial for team users with a limit of 1,000 blocks; from \$10/month/user for teams with unlimited blocks.
